

Grow and Behold Pastured Lamb Protocols

All **Grow and Behold Pastured Lamb** is produced from animals that are raised according to the following protocols. All farms supplying Grow and Behold Foods are subject to unannounced, random inspection by Grow and Behold employees to ensure compliance with these protocols.

- No synthetic or supplemental hormones in feed or implanted in lamb, EVER.
- Lamb will be fed a strictly vegetarian diet.
- Lamb will not be routinely treated with antibiotics. Antibiotics will only be used to treat a sick animal; use will cease after the animal has recovered and legally mandated withdrawal periods will be observed. Feed and water will never be treated with "prophylactic" antibiotics.
- Lamb will be raised in a manner that allows them to express their natural behavior. They will never be chained or confined in isolation except for special circumstances when farmer or animal safety requires it.
- Lamb will be weaned naturally when ever practical and grown on pastures of grasses and legumes and/or forest scrub and brushland (preference is given to indigenous species). Grazing lands are carefully managed for overgrazing and erosion.
- Animals may receive feed meal during transport for processing; this may include a mixture of grass, grain and peanuts. Collection and transportation facilities must be spacious and clean and are subject to unannounced inspection by Grow and Behold personnel at any time.
- Animals must be handled humanely during loading, trucking, transport and restraint. All possible efforts will be made to keep animals calm during processing by eliminating the use of electric prods and observing the best available protocols for animal handling.
- Sheep must be born and bred in the United States.
